Dear Hiring Manager,

I'm a computer science undergraduate focused on building practical software and using data and AI to solve real-world problems. I'm looking for opportunities to contribute my Python, full-stack development, and analytical skills while continuing to grow as an engineer.

I built TailorCV, an AI resume-optimization platform that has reached more than 500 users. Working across its FastAPI backend and PostgreSQL database, I developed resume scoring and tailoring features, payment integrations, and a Chrome extension that reduced application tailoring time from about 10 minutes to under a minute. I also introduced automated end-to-end testing and tools for monitoring reliability and user engagement.

My experience evaluating AI-generated Python fixes across more than 50 GitHub repositories strengthened my code-review and root-cause analysis skills; my findings contributed to a 15% improvement in model accuracy. I've also used Python, SQL, and Power BI to analyze 3,900 transaction records and turn customer behavior insights into actionable recommendations. Alongside my technical work, I've helped organize university events and workshops for large student audiences.

I would welcome the opportunity to bring this combination of software development, AI evaluation, and data analysis to a team with meaningful challenges. I look forward to discussing how I can contribute.

Sincerely,

Trisha Debnath
