Dear Hiring Manager,

I'm a technology-focused engineering student with experience building Python-based products, analyzing data, and evaluating AI-generated code. I'm seeking opportunities to apply these skills to practical challenges while continuing to grow as a developer and problem solver.

I built TailorCV, a full-stack resume optimization platform that has reached over 500 users, developing its ATS scoring and tailoring engine with Python and FastAPI. I also launched a Chrome extension that works across 15 job boards and reduced resume-tailoring time from about 10 minutes to under 60 seconds. In AI evaluation work, I assessed code fixes across 50+ GitHub repositories and used root-cause analysis to help improve model accuracy by 15%.

My experience also includes analyzing 3,900 transaction records with Python, SQL, and Power BI to identify customer and purchasing trends, as well as hands-on exposure to production planning, quality control, procurement, and inventory operations at Berger Paints. These projects have strengthened my technical judgment, analytical skills, and ability to turn findings into useful outcomes.

I would welcome the opportunity to discuss how my experience, initiative, and commitment to learning could contribute to your team. I look forward to connecting.

Sincerely,

*Trisha Debnath*
