I’m excited by the opportunity to contribute to your DevOps Engineer – Agentic Engineering team, where AI can make cloud operations more scalable and reliable. My experience building Python-based AI products and evaluating LLM outputs aligns with the role’s focus on practical automation, agent quality, and responsible oversight.

I built TailorCV, a full-stack resume optimization platform that has reached more than 500 users. I developed its ATS and tailoring engine with 22 weighted checks and safeguards against fabricated candidate details, and launched a Chrome extension that reduced tailoring time from about 10 minutes to under a minute. I also added end-to-end Playwright testing, Sentry monitoring, and product analytics—experience relevant to building and improving dependable automation workflows.

At Outlier, I evaluated AI-generated Python fixes across 50+ repositories using a 10-metric rubric, identified recurring failure patterns, and contributed to a 15% improvement in model accuracy through root-cause analysis. Alongside Python, FastAPI, PostgreSQL, and Git, I bring analytical experience from a customer behavior project using SQL, Python, and Power BI. I’m currently pursuing a B.Tech at Jadavpur University, with an 8.0 CGPA.

I’d welcome the opportunity to discuss how my AI evaluation, workflow automation, and product reliability experience can support your cloud and platform teams. I’m ready to contribute while growing my expertise in cloud-native infrastructure and agentic engineering.

Sincerely,

Trisha Debnath
